

midterm Proposal

You are to write a research paper. The topic is constrained to any subject under the umbrella of computer science. This proposal is a place for you to structure your thoughts and obtain the necessary background. You will have a little over a week to write the proposal and bring it to me in person for review before you can write your paper. The topic of the paper will not be constrained further than computer science as a whole, with that said I implore you too dive into a subject you find interesting. You will find peer-review papers and articles to support your paper and act as your reference to “the literature”. Use what we have learned in class thus far to relate the topics in your own words. Using the pseudocode we have gone over will be helpful in describing the math you may find in the literature. I will provide assistance over email or if you come see me in person.

Examples of Proposal

1. clear thesis (a subject)
2. a brief explanation of your analysis
3. a bibliography (tell me about the articles you found)

Your proposal should be around a page long.

Why is the assignment so open

I left this assignment very open ended to afford everyone ample room to explore the subject freely.
